

BKC WeatherSys
Integrated Systems since 1990

TOWER WEATHER MONITORING PLATFORM

WeatherOps Dashboard User Guide

A plain-language walkthrough of every screen in the dashboard
— what it shows, who it's for, and how to use it.

This guide walks through the WeatherOps dashboard one screen at a time. Each section explains, in plain language: **what the screen is for**, **what you see on it**, and **who typically uses it**. No coding or IT knowledge is needed to follow along.

Contents

1	Signing In & Creating an Account	Pg 3
	Logging in, self-registration, and who can see what	
2	Live Map — the main screen	Pg 4–5
	Interactive India map, weather layers, and the time slider	
3	Dashboard	Pg 6
	At-a-glance numbers and charts for the whole network	
4	Alerts	Pg 7
	Warnings, alert history, and forecast-change notices	
5	Reports	Pg 8–9
	Risk reports, daily bulletins (National & Circle-wise), region map, and forecast detail	
6	Forecast vs Actual (Comparison)	Pg 10
	How accurate past forecasts turned out to be	
7	Hazards & Advisories	Pg 11–12
	Cyclone tracking, flood risk, district risk intensity, and weekly advisory	
8	Other Useful Screens	Pg 13
	Tower list, live readings, past data, forecasts, and your profile	
9	Quick Reference	Pg 14
	Colour legend, roles, and glossary of terms	

The one thing to remember: almost everything in this dashboard is colour-coded on the same simple scale — **Green** (normal), **Yellow** (watch), **Orange** (alert), **Red** (warning). Once you recognise this scale, every map, chart and report in the system reads the same way.

● Green — Normal, nothing to act on

● Yellow — Watch, keep an eye on it

● Orange — Alert, attention needed soon

● Red — Warning, act now

Each numbered tab you see across the top of the dashboard (Live Map, Alerts, Reports, Comparison, Hazards) is a separate screen, covered in its own section below.

This is the first screen anyone sees. It decides **which towers and states a person is allowed to see** once they're inside the dashboard.

Signing in

An existing user enters their username and password and lands directly on the Live Map. If the details don't match, the system explains that plainly rather than letting them in.

Creating a new account (self-registration)

Anyone can create their own account from the "Sign up" link. The form asks for:

Basic details

- Full name, username, password
- Email address and mobile number
- Job title / designation (optional)

Location & alert preferences

- State → District → Circle (so alerts are relevant to them)
- How they want to be notified: Email, SMS, and/or WhatsApp

Who can see what (access levels):

- **Admin** — sees every state and every tower across the whole country (Pan-India).
- **Operator** — sees only the state(s) they've been assigned to (e.g. Delhi & Haryana).
- **Viewer** (this is what a new self-registered account becomes) — sees only their own registered state, on a read-focused basis.

A new registrant never sees data outside their own state until an administrator widens their access.

Once signed in, the same account and password work everywhere in the dashboard — there's no separate login for each screen.

This is the screen everyone lands on after logging in — a live, interactive map of India showing the current weather condition at every monitored tower.

Live Map — default nationwide view, colour-coded by current risk

How to move around the map

- 1 By default, every state is shown coloured by its current worst condition. Click a state to zoom in.
- 2 Zooming into a state reveals its districts, each coloured the same way, and the individual tower markers inside it.
- 3 Click any tower marker to open its details: exact readings, tower type, and site information.

A switcher lets you pick which weather condition is mapped — Temperature, Rainfall, Wind, Cloud, Visibility, Fog, Lightning, Snowfall, or Avalanche (full list on the next page). A small scrolling banner also appears above the map whenever the system is running on simulated/demo data rather than live station feeds, so it's always clear when you're looking at a demonstration rather than real readings.

Choosing what the map shows (layers)

A switcher lets you pick which weather condition is being mapped. The colours always follow the same Green → Yellow → Orange → Red scale, just for a different measurement:

LAYER	WHAT IT SHOWS	LAYER	WHAT IT SHOWS
Temperature	Heat levels	Fog	Reduced visibility from fog
Rainfall	Rain intensity	Lightning	Lightning strike activity
Wind	Wind speed	Snowfall	Snow (hill regions)
Cloud	Cloud cover	Avalanche	Avalanche risk (high-altitude sites)
Visibility	How far one can see		

Travelling through time

Below the map is a timeline slider with two modes:

7-Day view

Step backward or forward through the last week, day by day, to see how conditions trended.

Hourly view

Scrub hour-by-hour through a single day. Colours on the whole map update live as you move the slider — this is the fastest way to see where conditions are worsening or improving.

What the colours mean, exactly

Every layer uses the same four-step scale. Below is the Temperature layer as the reference example — other layers use the same idea with their own numbers (wind speed, rainfall rate, etc.).

COLOUR	MEANING	TEMPERATURE EXAMPLE
 Warning	Extreme — immediate attention	45°C or higher
 Alert	High — attention needed soon	40° – 44.9°C
 Watch	Moderate — keep monitoring	35° – 39.9°C
 No warning	Normal conditions	Below 35°C

Grey shading on the map means "no tower is monitoring this area yet" — it is deliberately a different colour from green, so "no data" is never mistaken for "safe."

Clicking a district or tower always shows its exact number (e.g. "41.2°C") alongside the colour, so decisions are never made on colour alone.

A single screen of numbers and charts summarising the health of the entire tower network — useful for a quick status check at the start of a meeting.

Dashboard — network overview with headline numbers and charts

The four headline numbers

TOTAL SITES	ACTIVE ALERTS	AVG. TEMPERATURE	RAINFALL TODAY
Towers monitored in total, plus active vs. under maintenance.	Unresolved warnings right now, split critical vs. high.	Current average reading across every active site.	Total rainfall today, plus sites currently at lightning risk.

The charts below them: **Average Temperature by Circle** (bar chart by region), **Active Alerts by Severity** (donut chart), **Top Rainfall Sites** (today's wettest towers), and **Recent Alerts** (clickable, jumps to the full Alerts screen).

This screen is read-only — it's a summary view. To act on an alert or dig into one site's detail, use the Alerts screen or click through from the Live Map.

This is where every weather warning across the network is listed, tracked, and closed out. It has three tabs.

Alerts — Active tab, showing triggered warnings with severity badges

Active

Warnings that are currently open. Each can be filtered by keyword, severity, or date. Clicking one opens its full detail, where it can be marked **Acknowledged** (seen, being handled) or **Resolved** (closed out).

History

The same list, but for warnings that have already been resolved — a record of what happened and when.

Deviations tab (forecast-change notices)

This is a different kind of alert. Instead of "the weather crossed a danger threshold," it flags: **"our forecast for this site changed significantly since the last time we checked."** For example: "Rainfall forecast for a site revised from 12mm to 38mm." This matters because a big last-minute change in the forecast itself is worth knowing about, even before the actual weather event happens. An unread count badge shows how many of these haven't been reviewed yet, and a "Run deviation check" button re-compares the latest forecasts on demand.

An alert is triggered automatically the moment a reading crosses a known danger threshold (e.g. wind above 60 km/h) — nobody has to manually flag it.

Where day-to-day operational reports are generated, reviewed and downloaded — the material typically shared with management or other departments. Four tabs:

Reports — Tower Risk Reports tab, with charts and site risk table

Tower Risk Reports

A live table of current and forecast weather risk for every tower, exportable straight to Excel or PDF for sharing outside the dashboard. It also includes a colour-coded **Region Map** and a district-by-district **Short & Long-Range Forecast** table — see the next page for both.

Daily Bulletin — National

A single-page, print-style summary of the day's weather risk picture across the whole country — designed to be circulated as a daily briefing document. See the next page for a live example.

Daily Bulletin — Circle Wise

The same daily bulletin concept, broken down by telecom circle/region instead of the whole country — useful when a regional team only needs their own area.

Saved Reports

A history of previously generated reports — who created each one, when, in what format (PDF/CSV/Excel), and its file size — so past reports can be re-downloaded without regenerating them.

Every export carries the company letterhead and a "Confidential — internal use only" footer automatically, so reports are meeting- and email-ready as soon as they're downloaded.

A closer look at the two daily bulletins and the detailed risk views inside Tower Risk Reports — the material most often printed or forwarded as-is.

Daily Bulletin — National: region-wise rainfall severity, today + 7-day outlook

Daily Bulletin — Circle Wise: same bulletin, filtered to one circle (Delhi NCR shown)

Region Map — district boundaries coloured by worst overall risk, with a day-by-day scrubber

Short & Long-Range Forecast — every district, every parameter, 3-day and 7-day outlook

Both bulletins and the forecast table can be downloaded as PDF directly from the screen (the button appears above each), ready to paste into an email or WhatsApp broadcast.

Answers one plain question: "How accurate were our forecasts, looking back?"

Comparison — forecast accuracy metrics and forecast-vs-actual chart

How to use it

- 1 Pick up to several towers to compare (a default set of towers is shown automatically).
- 2 Choose a date range in the past.
- 3 The screen lines up what was *forecast* for each day against what was *actually observed*, for temperature, rainfall, and wind.

Why this matters for a meeting

This is the evidence behind forecast reliability — useful when explaining to stakeholders how much confidence to place in the system's warnings, or when identifying whether a particular site/season needs closer attention because forecasts there have been drifting from reality.

This is a look-back / analysis tool, not a live alerting screen — it doesn't need to be checked daily, only when reviewing performance.

A dedicated screen for the bigger, slower-moving weather events that don't fit neatly into a single tower's reading — cyclones, floods, and forward planning.

Hazards — active cyclone tracker with storm path and category legend

Active Cyclone Tracker

Shows any current cyclone system's path — where it's been, where it's forecast to go, its strength category, and which districts have been issued a warning level.

Flood Map

A district-by-district flood risk view, worked out from current rainfall levels across each district's towers. See the next page for a live example.

Today's Risk Intensity of Districts

A single ranked view of every district's worst current condition, across every hazard type at once — the fastest way to see which districts need attention today.

Weekly Advisory

A forward-looking, plain-language note for the week ahead (e.g. monsoon preparation guidance), plus a preview of which registered users would be notified and on which channel (WhatsApp/SMS/Email). See the next page for a live example.

Other hazards — Lightning, Snowfall, Fog, and Avalanche — live as selectable layers directly on the Live Map (Section 2) rather than here, since they're per-tower readings rather than large moving systems like a cyclone.

A closer look at the district-level flood risk view and the weekly advisory that gets sent out to registered users ahead of the monsoon.

Flood Map — district-wise flood risk, derived from current rainfall (with active District Warnings above it)

Today's Risk Intensity — every district ranked Extreme → Low, per weather parameter

Weekly Advisories (Monsoon Preparation) — 7-day outlook per circle, with severity and a weather summary for each region

Each advisory row also tracks how many registered users would be notified and on which channel (WhatsApp/SMS/Email) — useful for confirming reach before a briefing goes out.

A few supporting screens, reached mainly by clicking through from elsewhere rather than from the top menu.

Sites
Monitored infrastructure sites and their current status.

Search by name, code, state, Circle, Status

Code	Site Name	Circle	State	Tower Type	Status	Installed On
TS-003	Adilabad South	Adilabad	Telangana	Monopole	Active	26 Jul 2019
UP-012	Agra Extension	UP (West)	Uttar Pradesh	GBT	Active	07 Aug 2021
MH-020	Almhadagar Extension	Maharashtra & Goa	Maharashtra	GBT	Active	19 Sep 2016
RJ-015	Ajmer Extension	Rajasthan	Rajasthan	Monopole	Active	12 Apr 2021
KL-019	Alappuzha North	Kerala	Kerala	Monopole	Active	18 Feb 2017
MP-027	Alotpur Rural	Madhya Pradesh & Chhattisgarh	Madhya Pradesh	GBT	Active	22 Feb 2021
UP-041	Alkhabad North	UP (East)	Uttar Pradesh	RTT	Inactive	14 Aug 2022
UK-004	Almora North	UP (West)	Uttarakhand	GBT	Active	28 Nov 2016
RJ-002	Alwar Extension	Rajasthan	Rajasthan	Monopole	Active	01 Jan 2020

My Profile — account & notification settings

Sites (Tower List)

A searchable, sortable table of every tower — code, name, region, state, tower type, and status (active / maintenance / inactive). Click any row to open that tower's full detail page.

Weather Observations

Live current-conditions cards or table for every tower at once, refreshing automatically — a live "weather board" view.

Historical Data

Pick one tower and a date range to see exactly what was recorded there in the past — for investigations or trend analysis.

Forecast

A multi-day (7-day) weather outlook for a single chosen tower.

My Profile

Where any signed-in user manages their own account: personal details, password changes, and their alert notification preferences (Email / SMS / WhatsApp) — the same choices made at registration, editable at any time.

Colour scale, used everywhere

COLOUR	ON THE MAP / ALERTS	ON REPORTS
■ Red	Warning	Extreme
■ Orange	Alert	High
■ Yellow	Watch	Moderate
■ Green	No warning	Normal

Note: Reports and the Map describe the exact same underlying risk scale with different wording — "Warning" on the map and "Extreme" on a report mean the same condition.

User roles, at a glance

ROLE	CAN SEE
Admin	Every state and tower nationwide
Operator	Only their assigned state(s)
Viewer	Only their own registered state

Glossary

Tower / Site	A single monitored physical location with weather sensors.
Circle	A regional grouping of towers (a telecom-industry term for a service region).
Tehsil	An administrative sub-division of a district, below district level.
Threshold	The pre-set number at which a reading is considered dangerous enough to raise an alert.
Deviation	A significant change between two successive forecasts for the same day/site.

For questions about access levels, a specific reading, or getting started, contact your system administrator.
